Mean 9.598; Variance 5.610; scale 1.711 Statistics: Pred, No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New oligo:nucleotide probes specific for Mycobacteria - used for detection and amplification of Mycobacteria nucleic acid in

(BECT) BECTON DICKINSON CO.

24-MAY-1993; 108325. 26-MAY-1992; US-889651.

Synthetic. EP-571911-A. 01-DEC-1993.

Oligonucleotide probe MK14-A Oligonucleotide; DNA probe; mycobacteria; disease diagnosis;

31-MAY-1994 (first entry)

Indels 12; Gaps 11; 123 gavasgnsakndhyrtnvrtgnsankngnnvvtnhghnnwtaraannyndartddrnhyn 182 ore 71; Match 8.9%; OryMatch 4.8%; Pred. No. 8.33e-29; 81; Conservative 258; Mismatches 564; Indels 12; Gaps The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodm. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr=114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can Natriuretic protein receptor B - for diagnosis and treatment of kidney failure, heart failure, hyperaldosteronism, glaucoma etc. Claim 3; Fig 1; 49pp; English. 51 T; 83 G; /note= "GC and protien kinase activity" 15 C; 87 A; /label= transmembrane domain Domain 479..1047 Chang M, Goeddel D, Lowe D; /label≔ cytoplasmic domain /label= N-glycos site Modified -site 277..279 456..456 /label= N-glycos_site Modified -site 161..163 /label= N-glycos site Modified -site 244..246 /label= N-glycos_site Modified -site 600..602 /label= N-glycos site Modified -site 195..197 /label= N-glycos site Modified -site 349..351 23-JUN-1989; US-370673. 24..26 /label= N-glycos site Modified -site 35..37 /label= N-glycos_site (GETH) GENENTECH INC 1047 BP; 10-JAN-1991. 22-JUN-1990; U03586. This fragment can be used for the preparation of a vaccine for hepatitis C. This fragment was prepared from the serum of non-A, non-B hepatitis patients and the envelope region DNA was amplified by PCR using the primer sequences given in (35073-76. Sequence 565 BP; 61 A; 92 C; 106 G; 85 T;

Differential screening in NIH3T3 cells (ATCC CRL-1658) and cloning, then insertion into vector pUC118 gave plasmid pMCO31 which contains the DNA coding for mouse OSF-1 (Q20695). This plasmid was used as a probe to clone by plaque hybridisation from a human cDNA library to gave a phage clone, HBR1. Insertion into vector pUC118 gave pHBR1 which may be used diagnostically or the OSF-1 cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and to a structural gene encoding a desired protein, e.g. proinsulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Host cells transformed with such plasmids produce fusion proteins in high yield. The ballast is short and does not disturb the folding of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This oligonucleotide is an example of a member of an oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         library encoding ballast constituents. The oligonucleotides are inserted into a vector, functionally linked to a regulatory region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the desired protein. The fusion protein is soluble or easily solubilised. The oligonucleotide encodes a cleavage site at its 3' end which allows easy removal of the ballast constituent. (GEHO) GEN HOSPITAL CORP. (FARH) HOECHST AG. 23-APR-1992; US-838221.

Seed B, Stengelin S, Uhlmann E, Ulmer W; WPI; 93-235119/29. Habermann P,

Fusion proteins for prodm. of e.g. pro-insulin - comprise gene for desired protein and oligo-nucleotide(s) encoding ballast

Claim 9; Column 30; 22pp; English.
This preferred mixed oligonucleotide encodes a ballast constituent and is inserted between a regulatory region and the structural gene encoding a desired protein, esp. pro-insulin. The short ballast component improves protease resistance of the fusion protein while protein

still allowing the desired protein to adopt its correct conformation

1 T; prior to cleavage of the ballast constituent. Sequence $39 \text{ BP}_i - 1 \text{ A}_i - 11 \text{ C}_i - 1 \text{ G}_i$ 11 C; 1 A;

ADRHUMJ 329 bp DNA VRL 22-SEP-1986 Adenovirus type 12/human recombinant viral DNA, recombination junction. DEFINITION **ACCESSION** 

Recombinant adenovirus type 12 viral DNA, clone 4al.1. recombination joint. KEYWORDS SOURCE

Viridae; ds-DNA nonenveloped viruses; Adenoviridae. 1 (bases 1 to 329) REFERENCE

Mastadenovirus h12

ORGANISM

Deuring, R. and Doerfler, W. AUTHORS TITLE

Proof of recombination between viral and cellular genomes in human KB cells productively infected by adenovius type 12: Structure of the junction site in a symmetric recombinant (SYREC) Gene 26, 283-289 (1983) Clean copy sequence for [1] kindly provided by R.Deuring and W.Doerfler, 15-JUL-1986. cDNA was ligated to Hind III adaptors (Pharmacia), digested with Not I and directionally cloned into the Not I and Hind III sites of the Lafmid BA vector. Library went through one round of normalization. Library constructed by Bento Soares and M.Fatima Bonaldo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      human clone=25883 library=Soares infant brain 1NIB vector=Lafmid BA

#### ALI GNMENTS

New polypeptide having properties of erythropoietin - is prepd. by cultivation of transformed eucaryotic or procaryotic host Disclosure; Page 43; 113pp; English. Human erythropoietin encoded by a sequence encoded by this phage Human erythropoietin encoded by positive clone (phage lambda-hEl) isolated from human fetal liver gene bank.
Erythropoietin; red blood cell; erythrocyte; anaemia; blood; disorder; ss; phage lambda-hEl; gene bank. P50300 standard; protein; 193 AA. 01-JAN-1980 (first entry) (KIRI-) KIRIN-AMGEN INC. sequence and various synthetic oligonucleotides corresponding to Epo and II-3 gene sequences. This molecule is comparable to the sequence given in R23076 and contains a flexible linker molecule. This hybrid growth factor is a haematopoietic molecule which contains at least a portion of an early MDE and at least a portion of a late MDE covalently linked. This compound can be used to promote heamatopoiesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    compounds are useful for treating anaemias of various origins eg.renal failure and AIDS. It is easier to produce and administer one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 131; Match 22.7%; QryMatch 5.0%; Pred.                                                                                                                                                    from the erythropoietin-producing human hepatoma cell Hp-1. The cDNA library was screened using the probes given in N70361 and N70362. A plasmid (named as p58-A20) was isolated. The nucleotide sequence of the cDNA obtained from this clone is shown in N70360.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EPO 104B was one of four positive clones isolated from a cDNA library prepd. from mRNA extracted from a human foetus of about 20 wk. gestation. The clone was identified using two probes, EPO1 and EPO2 based on the published sequence of EPO (Nature (1985) Vol.313,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence between nucleotides 63 and 724 has 100% homo-
h the published sequence. It encodes the 166 AAs of the

                                                                                                                                                                                                    A recombinant plasmid vector expressing this clone is expressed in e. g 373 or GHO cell cultures. The produced erythropoietin is useful for treatment of anaemia, especially renal anaemia. The cloned gene expresses high levels of the protein and thus provides a means of mass production.                                                                                                                                 The analogue was constructed to add an N-glycosylation site at Asn125 (amino acid 154 in this sequences) and was produced by expression of DNA obtained by site-directed mutagenesis of DNA encoding EPO. The analogue has a higher sialic acid content than human EPO and has increased biological activity. It can be used to treat mammals to cause bone marrow cells to increase prodn. of reticulocytes and red blood
